

C1 r has an interval now (n=1143 edges in 48 systems); permutation $p \leq 0.001$

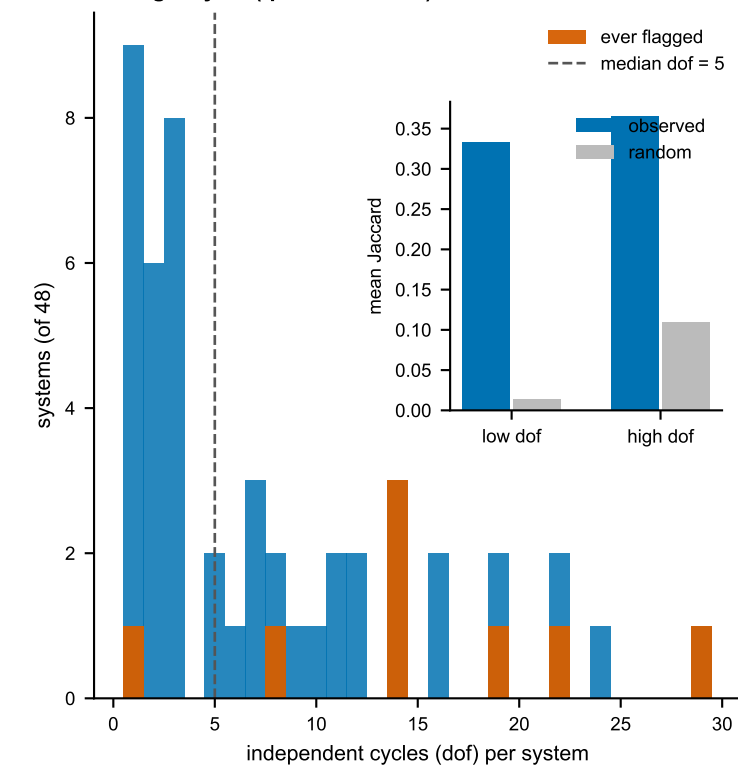

C2 the missing half of the two-way null: the cutoff contrast excludes zero

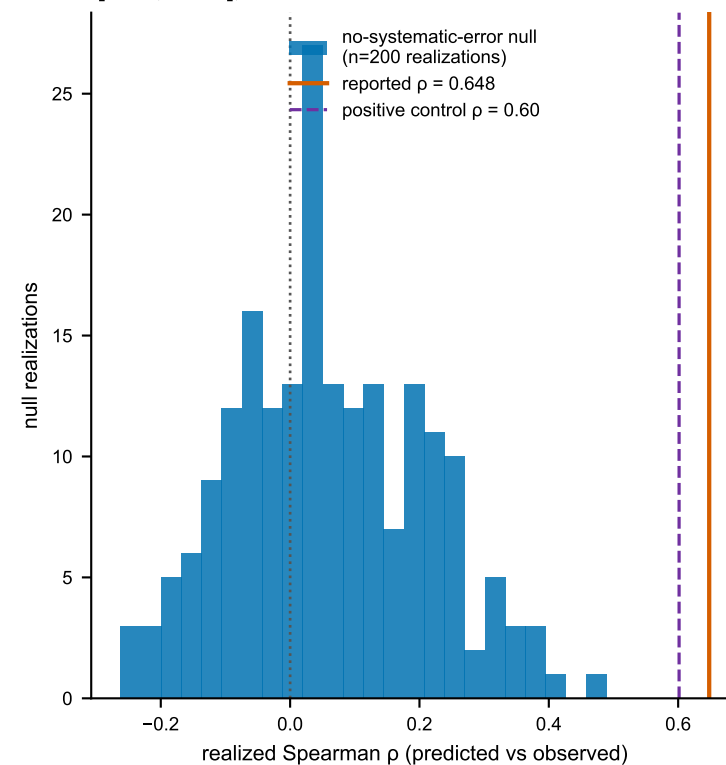

C3 'the aggregate also matches': observed is 1.6× predicted and outside its interval

C4 dof distribution: 9 systems have a single cycle (quartiles 2/5/12)

C5 shared-denominator null: $\rho = +0.059$ [-0.20, +0.36], so 0.648 is not an artefact

C6 Wade's functional: 9 of 34 targets exceed the perfect-calibration reference
